Project progress

Rolfe • February 26, 2026 • Estimated reading time: 1 min

What

I reviewed the progress I have made so far with my project with my tutor. In terms of coding the application, I think the progress flow is going well. So far, I am satisfied. I will continue to add necessary features and apply the changes the lecturer has advised me to make. But in terms of my artefacts, I have not gathered much documentation, and I have not written reflections that can show the understanding I have about the coding choices I have made for the project. This is because I don't enjoy writing as much as coding, so I end up giving less importance and leave this task to do as last priority.

So What

Right now, due to the lack of written reflections and research documentation, I can't demonstrate my thought process throughout the course of the project. This is bad because I can't explain where I got my information and why I chose a certain coding technique over another. From my perspective, I wouldn't have a way to go back and see the errors I did and how I solved them. From someone else's perspective, it would look as if I took the code from someone or somewhere without analysing how it works.

Now What

From now I will focus more on the written part of the project. I should write reflections weekly and document my reasoning as I code, because if I keep postponing this task, I will have a hard time remembering the thought process I had for each phase of the project, and I will not be able to write reliable and precise reflections. This will help me better articulate my coding and design choices, and will also improve the quality of my reflections as time goes on.
