What

This week I focused on polishing the website a little bit more. I did not add any security features, nor any new functionality. I added some pop-up messages that will show the result of a transaction to the user. This took some time since I struggled a little bit to properly display dynamic data with JavaScript, and currently, some of the pages are still missing pop-ups. Furthermore, I tried to improve the structure of the code.It is currently written in an unorganised way, which makes it very hard to read and understand, as it keeps becoming more complex. The last thing I added was a function that also logs failed transactions.

So What

This matters because the application lacked clear user feedback, the user should not have to guess of what happened with their money, as they would grow distrustful of the software very quickly. With this feedback, the user is now aware of the outcome of the transaction. The addition of failed transaction logging is also significant. Initially, I focused only on successful transactions, but failed transactions are equally important, as they can indicate potential errors or suspicious activity on an account. This improves both usability and security awareness.

Now What

Moving forward, I need to complete the remaining pop-up implementations to ensure consistency across all pages. I also plan to further refactor my code to improve readability and maintainability, potentially by organising it into clearer functions or modules.

Additionally, some features were not implemented due to poor time management. Starting the project earlier would have allowed more time to develop both functionality and security features. In future projects, I will plan my time more effectively to avoid similar limitations.
